Management Information Base for the User Datagram Protocol (UDP)

Status of This Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects used for implementations of the User Datagram Protocol (UDP) in an IP version independent manner. This memo obsoletes RFCs 2013 and 2454.

1. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current Internet-Standard Management Framework, please refer to section 7 of RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. MIB objects are generally accessed through the Simple Network Management Protocol (SNMP). Objects in the MIB are defined using the mechanisms defined in the Structure of Management Information (SMI). This memo specifies a MIB module that is compliant to the SMIV2, which is described in STD 58, RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579] and STD 58, RFC 2580 [RFC2580].

2. Overview

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in the Internet community. In particular, it describes managed objects used for implementations of the User Datagram Protocol (UDP), as defined in RFC 768 [RFC0768], in an IP version independent manner.

The current UDP-MIB defined in this memo consists of one table and a group of scalars:

- o The udp group of scalars reports parameters and statistics of a UDP protocol engine. Two scalars, udpHCInDatagrams and udpHCOutDatagrams, have been added to this group since the publication of RFC 2013 [RFC2013] in order to provide high-capacity counters for fast networks. Discontinuities in the values of the counters in this group are indicated by discontinuities in the value of the sysUpTime object, which is defined in RFC 3418 [RFC3418].
- o The udpEndpointTable provides access to status information for all UDP endpoints handled by a UDP protocol engine. The table provides for strictly listening endpoints, as with the historical udpTable, and also for "connected" UDP endpoints, which only accept packets from a given remote system. It also reports identification of the operating system level processes that handle UDP connections. Addresses and ports of UDP endpoints in this table are represented using the InetAddressType, InetAddress, and InetPortNumber textual conventions defined in RFC 4001 [RFC4001].

2.1. Relationship to Other MIBs

This section discusses the relationship of this UDP-MIB module to other MIB modules.

2.1.1. Relationship to RFC1213-MIB

UDP related MIB objects were originally defined as part of the RFC1213-MIB, defined in RFC 1213 [RFC1213]. The UDP related objects of the RFC1213-MIB were later copied into a separate MIB module and published in RFC 2013 [RFC2013] in SMIV2 format.

The previous versions of the UDP-MIB both defined the `udpTable`, which has been deprecated for basically two reasons:

- (1) The `udpTable` only supports IPv4.

The current approach in the IETF is to write IP version neutral MIBs rather than have different definitions for various version of IP. This reduces the amount of overhead when new objects are introduced, since there is only one place to add them. Hence, the approach taken in RFC 2454 [RFC2454] of having separate tables is not continued.

- (2) The `udpTable` does not permit describing "connected" UDP endpoints.

It turns out that "connected" endpoints tend to have a different behaviour and management access pattern from those of listening endpoints. Adding remote endpoint information to the `udpEndpointTable` thus allows for the addition of specific status and statistic objects for "connected" endpoints and connections.

2.1.2. Relationship to the IPV6-UDP-MIB

The IPV6-UDP-MIB, defined in RFC 2454 [RFC2454], has been moved to Historic because the approach of having separate IP version specific tables is not followed anymore. Implementation of RFC 2454 is thus not suggested anymore.

Note that because scoped addresses are now represented using the `IPv4z` and `IPv6z` address types, there is no longer a need to explicitly include the `ifIndex` in the index clause of the `udpEndpointTable`. This is a change from the use of `ipv6UdpIfIndex` in RFC 2454.

2.1.3. Relationship to HOST-RESOURCES-MIB and SYSAPPL-MIB

The udpEndpointTable reports the identification of the operating system level process that handles a connection or a listening endpoint. The value is reported as an Unsigned32, which is expected to be the same as the hrSWRunIndex of the HOST-RESOURCES-MIB [RFC2790] (if the value is smaller than 2147483647) or the sysAppElmtRunIndex of the SYSAPPL-MIB [RFC2287]. This allows management applications to identify the UDP connections that belong to an operating system level process, which has proven valuable in operational environments.

DESCRIPTION

"The MIB module for managing UDP implementations.
Copyright (C) The Internet Society (2005). This
version of this MIB module is part of RFC 4113;
see the RFC itself for full legal notices."

REVISION "200505200000Z" -- May 20, 2005

DESCRIPTION

"IP version neutral revision, incorporating the
following revisions:

- Added udpHCInDatagrams and udpHCOutDatagrams in order to provide high-capacity counters for fast networks.
- Added text to the descriptions of all counter objects to indicate how discontinuities are detected.
- Deprecated the IPv4-specific udpTable and replaced it with the version neutral udpEndpointTable. This table includes support for connected UDP endpoints and support for identification of the operating system process associated with a UDP endpoint.
- Deprecated the udpGroup and replaced it with object groups representing the current set of objects.
- Deprecated udpMIBCompliance and replaced it with udpMIBCompliance2, which includes the compliance information for the new object groups.

This version published as RFC 4113."

REVISION "199411010000Z" -- November 1, 1994

udpEndpointTable OBJECT-TYPE

SYNTAX SEQUENCE OF UdpEndpointEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"A table containing information about this entity's UDP endpoints on which a local application is currently accepting or sending datagrams.

The address type in this table represents the address type used for the communication, irrespective of the higher-layer abstraction. For example, an application using IPv6 'sockets' to communicate via IPv4 between `::ffff:10.0.0.1` and `::ffff:10.0.0.2` would use `InetAddressType ipv4(1)`.

Unlike the `udpTable` in RFC 2013, this table also allows the representation of an application that completely specifies both local and remote addresses and ports. A listening application is represented in three possible ways:

- 1) An application that is willing to accept both IPv4 and IPv6 datagrams is represented by a `udpEndpointLocalAddressType` of `unknown(0)` and a `udpEndpointLocalAddress` of `'h` (a zero-length octet-string).
- 2) An application that is willing to accept only IPv4 or only IPv6 datagrams is represented by a `udpEndpointLocalAddressType` of the appropriate address type and a `udpEndpointLocalAddress` of `'0.0.0.0'` or `:::` respectively.
- 3) An application that is listening for datagrams only for a specific IP address but from any remote system is represented by a `udpEndpointLocalAddressType` of the appropriate address type, with `udpEndpointLocalAddress` specifying the local address.

In all cases where the remote is a wildcard, the `udpEndpointRemoteAddressType` is `unknown(0)`, the `udpEndpointRemoteAddress` is `'h` (a zero-length octet-string), and the `udpEndpointRemotePort` is 0.

If the operating system is demultiplexing UDP packets by remote address and port, or if the application has 'connected' the socket specifying a default remote address and port, the `udpEndpointRemote*` values should be used to reflect this."

udpEndpointLocalAddress OBJECT-TYPE

SYNTAX InetAddress

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

"The local IP address for this UDP endpoint.

The value of this object can be represented in three

possible ways, depending on the characteristics of the listening application:

1. For an application that is willing to accept both IPv4 and IPv6 datagrams, the value of this object must be ''h (a zero-length octet-string), with the value of the corresponding instance of the udpEndpointLocalAddressType object being unknown(0).
2. For an application that is willing to accept only IPv4 or only IPv6 datagrams, the value of this object must be '0.0.0.0' or ':::', respectively, while the corresponding instance of the udpEndpointLocalAddressType object represents the appropriate address type.
3. For an application that is listening for data destined only to a specific IP address, the value of this object is the specific IP address for which this node is receiving packets, with the corresponding instance of the udpEndpointLocalAddressType object representing the appropriate address type.

As this object is used in the index for the udpEndpointTable, implementors of this table should be careful not to create entries that would result in OIDs with more than 128 subidentifiers; else the information cannot be accessed using SNMPv1, SNMPv2c, or SNMPv3."

4. Acknowledgements

This document contains a modified subset of RFC 1213 and replaces RFCs 2013 and 2454. Acknowledgments are therefore due to the authors and editors of these documents for their excellent work.

5. Contributors

This document is an output of the IPv6 MIB revision team, and contributors to earlier versions of this document include:

Bill Fenner, AT&T Labs -- Research
 Email: fenner@research.at.com

Brian Haberman
Email: brian@innovationslab.net

Shawn A. Routhier, Wind River
Email: sar@epilogue.com

Juergen Schoenwalder, TU Braunschweig
Email: schoenw@ibr.cs.tu-bs.de

Dave Thaler, Microsoft
Email: dthaler@windows.microsoft.com

Much of Keith McCloghrie's text from RFC1213/RFC2013 remains in this document, and the structure of the MIB is due to him.

Mike Daniele wrote the original IPv6 UDP MIB in RFC2454.

Juergen Schoenwalder provided much of the text for section 2.

6. Security Considerations

There are no management objects defined in this MIB that have a MAX-ACCESS clause of read-write and/or read-create. So, if this MIB is implemented correctly, then there is no risk that an intruder can alter or create any management objects of this MIB module via direct SNMP SET operations.

Some of the readable objects in this MIB module (i.e., objects with a MAX-ACCESS other than not-accessible) may be considered sensitive or vulnerable in some network environments. It is thus important to control even GET and/or NOTIFY access to these objects and possibly to even encrypt the values of these objects when sending them over the network via SNMP. These are the tables and objects and their sensitivity/vulnerability:

The indices of the udpEndpointTable and udpTable contain information on the listeners on an entity. In particular, the udpEndpointLocalPort and udpLocalPort objects in the indices can be used to identify what ports are open on the machine and what attacks are likely to succeed, without the attacker having to run a port scanner.

SNMP versions prior to SNMPv3 did not include adequate security. Even if the network itself is secure (for example by using IPsec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB module.

It is recommended that the implementors consider the security features as provided by the SNMPv3 framework (see [RFC3410], section 8), including full support for the SNMPv3 cryptographic mechanisms (for authentication and privacy).

Furthermore, deployment of SNMP versions prior to SNMPv3 is NOT RECOMMENDED. Instead, it is RECOMMENDED to deploy SNMPv3 and to enable cryptographic security. It is then a customer/operator responsibility to ensure that the SNMP entity giving access to an instance of this MIB module is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.

7. IANA Considerations

The MIB module in this document uses the following IANA-assigned OBJECT IDENTIFIER values, recorded in the SMI Numbers registry:

+-----+ Descriptor	+-----+ OBJECT IDENTIFIER value
+-----+	+-----+
udp	{ mib-2 7 }
udpMIB	{ mib-2 50 }
+-----+	+-----+

This document is subject to the rights, licenses and restrictions contained in BCP 78, and except as set forth therein, the authors retain all their rights.

This document and the information contained herein are provided on an "AS IS" basis and THE CONTRIBUTOR, THE ORGANIZATION HE/SHE REPRESENTS OR IS SPONSORED BY (IF ANY), THE INTERNET SOCIETY AND THE INTERNET ENGINEERING TASK FORCE DISCLAIM ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Intellectual Property

The IETF takes no position regarding the validity or scope of any Intellectual Property Rights or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; nor does it represent that it has made any independent effort to identify any such rights. Information on the procedures with respect to rights in RFC documents can be found in BCP 78 and BCP 79.

Copies of IPR disclosures made to the IETF Secretariat and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this specification can be obtained from the IETF on-line IPR repository at <http://www.ietf.org/ipr>.

The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights that may cover technology that may be required to implement this standard. Please address the information to the IETF at ietf-ipr@ietf.org.
