## Definitions of Managed Objects for Common Open Policy Service (COPS) Protocol Clients

### Status of this Memo

This document specifies an Internet standards track protocol for the Internet community, and requests discussion and suggestions for improvements. Please refer to the current edition of the "Internet Official Protocol Standards" (STD 1) for the standardization state and status of this protocol. Distribution of this memo is unlimited.

### Copyright Notice

### Abstract

This memo defines a portion of the Management Information Base (MIB) for use with network management protocols in TCP/IP based internets. In particular it defines objects for managing a client of the Common Open Policy Service (COPS) protocol.

This memo includes a MIB module in a manner that is compliant to the SMIV2 [V2SMI].

## 1. The SNMP Management Framework

The SNMP Management Framework presently consists of five major components:

- o An overall architecture, described in an Architecture for Describing SNMP Management Frameworks [ARCH].
- o Mechanisms for describing and naming objects and events for the purpose of management. The first version of this Structure of Management Information (SMI) is called SMIV1 and described in STD 16, RFC 1155 [V1SMI], STD 16, RFC 1212 [V1CONCISE] and RFC 1215 [V1TRAPS]. The second version, called SMIV2, is described in STD 58, RFC 2578 [V2SMI], STD 58, RFC 2579 [V2TC] and STD 58, RFC 2580 [V2CONFORM].
- o Message protocols for transferring management information. The first version of the SNMP message protocol is called SNMPV1 and described in STD 15, RFC 1157 [V1PROTO]. A second version of the SNMP message protocol, which is not an Internet standards track protocol, is called SNMPV2C and described in RFC 1901 [V2COMMUNITY] and RFC 1906 [V2TRANS]. The third version of the message protocol is called SNMPV3 and described in RFC1906 [V2TRANS], Message Processing and Dispatching [V3MPC] and User-based Security Model [V3USM].
- o Protocol operations for accessing management information. The first set of protocol operations and associated PDU formats is described in STD 15, RFC 1157 [V1PROTO]. A second set of protocol operations and associated PDU formats is described in RFC 1905 [V2PROTO].
- o A set of fundamental applications described in SNMPV3 Applications [V3APPS] and the view-based access control mechanism described in View-based Access Control Model [V3VACM].

A more detailed introduction to the current SNMP Management Framework can be found in RFC 2570 [V3INTRO].

Managed objects are accessed via a virtual information store, termed the Management Information Base or MIB. Objects in the MIB are defined using the mechanisms defined in the SMI.

This memo specifies a MIB module that is compliant to the SMIV2. A MIB conforming to the SMIV1 can be produced through the appropriate translations. The resulting translated MIB must be semantically equivalent, except where objects or events are omitted because no

translation is possible (use of Counter64). Some machine readable information in SMIV2 will be converted into textual descriptions in SMIV1 during the translation process. However, this loss of machine readable information is not considered to change the semantics of the MIB.

## 2. Overview

The COPS protocol [COPS] is a client-server protocol intended for the communication of policy requests and decisions between a Policy Enforcement Point (PEP) and a Policy Decision Point (PDP). The PEP acts as a COPS client in this scenario. The model for policy outsourcing, of which the COPS protocol provides one part, is described in [FRAMEWORK].

### 2.1. Scope

This MIB is intended to provide management of the important features of a COPS protocol client module. It does not provide management for a COPS server - this is outside the scope of the current memo. It provides for monitoring of status and protocol statistics, as well as for configuration of the client, in particular for telling it where to locate its servers. Other mechanisms for achieving this function without SNMP configuration might include use of the Service Location Protocol [SRVLOC] although this is outside the scope of this memo and are not specified by the COPS protocol itself.

This MIB also does not provide management of specific COPS client-types e.g., for use with the RSVP protocol [RSVP][COPSRSPV].

## 3. Structure of COPS Client MIB

Objects in this MIB are arranged into groups. Each group is organized as a set of related objects. The overall structure is described below.

### 3.1. copsClientCapabilitiesGroup

This group contains objects that represent COPS protocol capabilities implemented by this COPS client.

### 3.2. copsClientStatusGroup

This group contains objects that indicate the current status of connection(s) to COPS servers, including per-server protocol statistics. It maintains last-known statistics for all of the servers with which the client has ever been connected since agent restart.

### 3.3. copsConfigGroup

This group contains objects that allow for configuration of COPS server addresses and the order to which connections should be attempted. It contains a table of per-server objects as well as scalars for configuration of the retry algorithm to be used by a client to obtain a connection to an appropriate server.

### 3.4. Textual Conventions

The datatypes CopsClientState, CopsServerEntryType, CopsErrorCode, CopsTcpPort and CopsAuthType are used as textual conventions in this document. These textual conventions have NO effect on either the syntax nor the semantics of any managed object. Objects defined using these conventions are always encoded by means of the rules that define their primitive type. Hence, no changes to the SMI or the SNMP are necessary to accommodate these textual conventions which are adopted merely for the convenience of readers.

### 3.5. Relationship to Other MIBs

#### 3.5.1. Relationship to the 'system' group

This MIB contains definitions for a single COPS protocol client represented by a single SNMP agent and instance of the MIB-2 system group [MIB2]. It does not address the case of multiple co-located COPS protocol clients.

## 4. Definitions for COPS Client MIB

    "The COPS protocol Client-Type for which this entry
     applies and for which this COPS server is capable
     of serving. Multiple Client-Types can be served by a
     single COPS server."

```

## REFERENCE

"RFC 2748 section 6, IANA"

::= { copsClientServerConfigEntry 3 }

## copsClientServerConfigAuthType OBJECT-TYPE

SYNTAX CopsAuthType

MAX-ACCESS not-accessible

STATUS current

## DESCRIPTION

"The type of authentication mechanism for this COPS client to request when negotiating security at the start of a connection to a COPS server."

## REFERENCE

"RFC 2748 section 4."

::= { copsClientServerConfigEntry 4 }

## copsClientServerConfigTcpPort OBJECT-TYPE

SYNTAX CopsTcpPort

MAX-ACCESS read-create

STATUS current

## DESCRIPTION

"The TCP port number on the COPS server to which the client should connect."

::= { copsClientServerConfigEntry 5 }

## copsClientServerConfigPriority OBJECT-TYPE

SYNTAX Integer32

MAX-ACCESS read-create

STATUS current

## DESCRIPTION

"The priority of this entry relative to other entries. COPS client will attempt to contact COPS servers for the appropriate Client-Type. Higher numbers are tried first. The order to be used amongst server entries with the same priority is undefined. COPS servers that are notified to the client using the COPS protocol PDP-Redirect mechanism are always used in preference to any entries in this table."

::= { copsClientServerConfigEntry 6 }

## copsClientServerConfigRowStatus OBJECT-TYPE

SYNTAX RowStatus

MAX-ACCESS read-create

STATUS current

## DESCRIPTION

"State of this entry in the table."

::= { copsClientServerConfigEntry 7 }

## copsClientServerConfigRetryAlgrm OBJECT-TYPE

```
SYNTAX      INTEGER {
                other(1),
                sequential(2),
                roundRobin(3)
            }
```

```
MAX-ACCESS  read-write
```

```
STATUS      current
```

## DESCRIPTION

"The algorithm by which the client should retry when it fails to connect to a COPS server."

```
DEFVAL { sequential }
```

```
::= { copsClientConfigGroup 2 }
```

## copsClientServerConfigRetryCount OBJECT-TYPE

```
SYNTAX      Unsigned32
```

```
MAX-ACCESS  read-write
```

```
STATUS      current
```

## DESCRIPTION

"A retry count for use by the retry algorithm. Each retry algorithm needs to specify how it uses this value."

For the 'sequential(2)' algorithm, this value is the number of times the client should retry to connect to one COPS server before moving on to another.

For the 'roundRobin(3)' algorithm, this value is not used."

```
DEFVAL { 1 }
```

```
::= { copsClientConfigGroup 3 }
```

## copsClientServerConfigRetryIntvl OBJECT-TYPE

```
SYNTAX      TimeInterval
```

```
UNITS       "centi-seconds"
```

```
MAX-ACCESS  read-write
```

```
STATUS      current
```

## DESCRIPTION

"A retry interval for use by the retry algorithm. Each retry algorithm needs to specify how it uses this value."

For the 'sequential(2)' algorithm, this value is the time to wait between retries of a connection to the same COPS server.

For the 'roundRobin(3)' algorithm, the client always attempts to connect to each Server in turn, until one succeeds or they all fail; if they all fail, then the client waits for the value of this interval before restarting the algorithm."

```
DEFVAL { 1000 }
```

```
::= { copsClientConfigGroup 4 }
```

## 5. Acknowledgments

This document describes instrumentation for the client side of the COPS protocol which was defined by the RSVP Admission Policy (rap) Working Group, now known as the Resource Allocation Protocol (rap) Working Group.

## 6. Security Considerations

There are a number of management objects defined in this MIB that have a MAX-ACCESS clause of read-create. Such objects may be considered sensitive or vulnerable in some network environments. The support for SET operations in a non-secure environment without proper protection can have a negative effect on network operations.

SNMPv1 by itself is not a secure environment. Even if the network itself is secure (for example by using IPSec), even then, there is no control as to who on the secure network is allowed to access and GET/SET (read/change/create/delete) the objects in this MIB.

It is recommended that the implementers consider the security features as provided by the SNMPv3 framework. Specifically, the use of the User-based Security Model [USM] and the View-based Access Control Model [VACM] is recommended.

It is then a customer/user responsibility to ensure that the SNMP entity giving access to an instance of this MIB, is properly configured to give access to the objects only to those principals (users) that have legitimate rights to indeed GET or SET (change/create/delete) them.
